To disrupt gray-market and counterfeit channels, a manufacturer of power-management equipment adopts innovative, tamper-proof laser marking.

**SUMMARY**

In the commercial and industrial electronics market, the smallest misstep in manufacturing or testing can mean costly repairs, property damage, and even serious injury or death.

Aware that its reputation is on the line with every circuit breaker sold, a multinational electrical-equipment manufacturer has for years channeled substantial resources into fighting gray-market and counterfeit products, often via litigation. Recently the company adopted a preemptive strategy based on making counterfeiting more difficult and illicit supply chains easier to trace.

Powering this campaign is a close collaboration with MECCO and iTRACE Technologies. Together, the three enterprises have tailored an advanced marking-and-tracing approach that eliminates risks ranging from lost revenues to potential service and warranty liabilities.

**GLOBAL CONTEXT**

60% of participating OEMs reported seeing increased gray-market activity since 2008.

90% reported finding their products available outside approved channels.

**CHALLENGES**

**SETTING PARAMETERS FOR SUCCESS**

Motivating our customer—a leading manufacturer of power-management equipment—were complaints from sales team members and authorized retailers that circuit breakers were being diverted into gray-market channels, re-labeled with falsified performance information, and sold at a higher price. The products in question are high-volume items that protect devices connected to low-voltage distribution systems. The company was facing lost revenues and potential service and warranty issues.

Trend watchers in the electrical-equipment industry acknowledge the scale of the problem: A January 2017 report from Research and Markets, “Global Circuit Protection Market 2017 – 2021,” notes a surge in gray-market trading that will impede industry growth in the next three to five years.
Our customer requested a solution that would meet four business conditions:

» Reduce revenues lost to the gray market
» Prevent losses due to false warranty or liability claims involving counterfeit products
» Reduce legal and brand-protection costs
» Improve distributor and retailer satisfaction

...and three technical requirements:

» Eliminate easy-to-tamper-with or easy-to-remove labels and packaging without affecting the product’s look and feel
» Ensure quick identification of genuine, but remarked or relabeled products, even if packaging has been removed and they have been installed
» Boost capital-equipment value and ROI by augmenting the customer’s installed base of MECCO laser marking technology

What made this solution possible was the technology integration of iTRACE Technologies, the leading provider of unique identity (UID) solutions with MECCO, the world’s leader in turnkey industrial part marking and product tracking. The pairing would support the first direct integration of the iTRACE 2DMI software suite with a production-level laser marking system.

The most conspicuous outcome would be overt and covert marks, indelibly laser-etched into every circuit breaker’s molded case. MECCO’s SMARTmark Fiber Laser Marking System features rotary indexing and integrated vision, which identifies each part by bar code. SMARTmark pulls the appropriate marking information from the manufacturer’s enterprise resource planning (ERP) database, then applies it to as many as four sides of the part.

But marking is only as good as the information it carries. Secure, proprietary, encrypted 2DMI data would add:

» Integration with existing database, software, and marking system
» Simplified logistics, thanks to coupling with standard 1D and 2D codes
» An extremely compact individual-mark footprint (<0.25mm with standard lasers)
» High-speed marking capabilities

According to industry experts, OEM losses due to gray-market sales hover around 15 to 20 percent of potential sales revenue, across almost all industries. Other sources, including the consumer-products giant Unilever, estimate losses to counterfeiting at 1 percent of annual turnover.

**SOLUTION**

**A NEW DIMENSION FOR TWO SUCCESSFUL SYSTEMS**

After selecting the MECCO/iTRACE team for its integrated approach and superior grasp of the challenge, our customer participated actively during the initial development period. The result was an innovative marking and traceability solution in which the iTRACE 2DMI software suite would mesh seamlessly with the proven MECCO marking technology already in place.

How it works: product security

1. Manufacturer generates unique identification numbers
2. 2DMI generates one-of-a-kind patterns, encoding individual IDs.
3. MECCO laser system engraves unique 2DMI patterns on individual parts, both overtly and covertly.
MECCO, the leader in OEM-to-turnkey marking systems, enables the world’s leading manufacturers to achieve higher efficiencies, reduce manufacturing costs, and increase quality by implementing full serialization and traceability solutions.
